

ENERGY EXCHANGES

LAWS OF THERMODYNAMICS

First Law	Second Law

ENERGY EXCHANGES

EXERGONIC REACTIONS	ENDERGONIC REACTIONS
	

COUPLED REACTIONS

ATP

STRUCTURE

PRODUCTION

ATP & COUPLED REACTIONS

QUESTIONS:

1. Define each of the following terms:

Term	Definition
Metabolism	
Catabolism	
Anabolism	

2. Identify each of the following as true of Catabolism or Anabolism.

_____ Release energy	_____ “Downhill” reaction
_____ Store/consume energy	_____ “Uphill” reaction
_____ Build complex molecules	_____ Photosynthesis
_____ Break down complex molecules	_____ Cellular respiration

3. Define the following terms:

Term	Definition
Energy	
Kinetic Energy	
Potential Energy	

4. Identify each of the following as having kinetic energy (**KE**) or potential energy (**PE**).

_____ Child at top of slide	_____ Water turning turbines
_____ Child sliding down slide	_____ Glucose
_____ Water behind dam	_____ Food molecules

5. According to the First Law of Thermodynamics, if the total energy before a reaction is 500 kcal, then the total energy after the reaction must be:

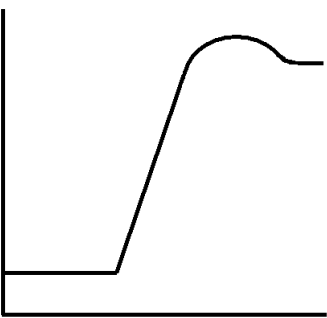

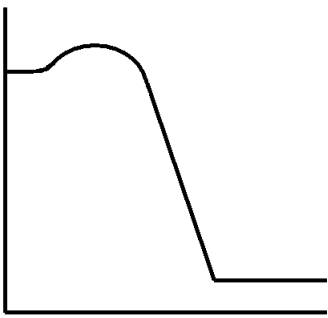

6. According to the Second Law of Thermodynamics, if the total energy before an energy exchange is 500 kcal, then the amount of useful energy after the exchange is:

- a. Less than 500 kcal
- b. 500 kcal
- c. More than 500 kcal

7. Does the Second Law of Thermodynamics contradict the First Law? Explain.

8. Do highly ordered living organisms violate the Second Law of Thermodynamics? Explain.

10. Complete the following chart:

	Graph A	Graph B
		
Is ΔG positive or negative		
Exergonic or Endergonic		
Spontaneous Yes or No		
Uphill or Downhill Reaction		
Products have more or less energy than reactants		

11. Of the light energy reaching the earth from the sun, the earth's plants are believed to convert less than 1% into the form of potential energy stored in the chemical bonds of food molecules. What happens to the rest of the energy?

12. Organisms cannot use heat energy to drive their energy-requiring processes. Does this mean that the heat released by metabolism is of no use to them? Why or why not?

13. Shown below is an energy pyramid for an ecosystem. Use this pyramid to answer the questions that follow.

- a. What happens to the amount of available energy at each trophic level?

- b. Use the laws of thermodynamics to explain why this happens.

15. Explain how ATP performs work.

16. When ATP is produced, energy is required. What is the source of this energy?

17. When ATP is broken, energy is released. How is this energy used?
